ICD OPACI-COAT®

SPANDREL APPLICATIONS

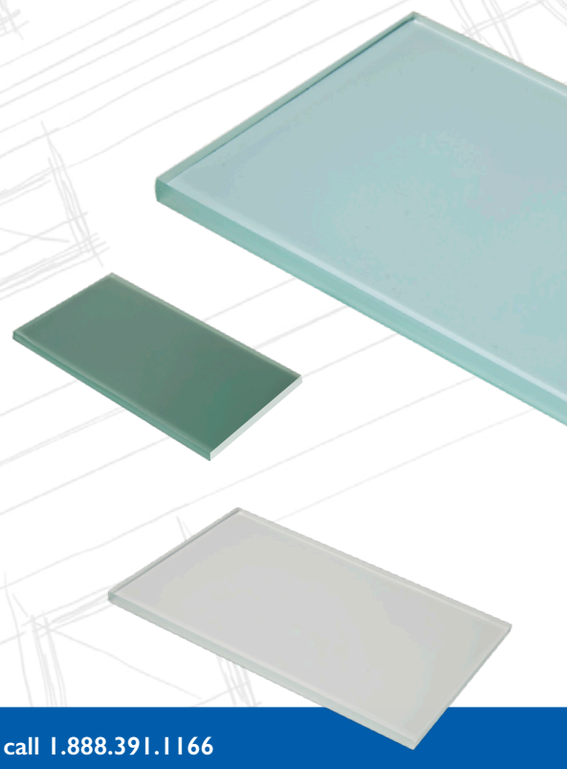

Spandrel glass provides a cost-effective option to mask or accentuate areas of a building facade. To meet your design vision Vitrum offers spandrel as monolithic glass, laminated glass, or as a sealed unit and is available in both ICD Opaci-Coat 300® and roll-coated ceramic frit. Depending on the color selected, spandrel glass can harmonize, contrast or be an accent to the vision glass areas. To ensure optimum performance, spandrel must always be installed in front of a uniform dark back-ground. For vision applications, Vitrum recommends ceramic frit with a screen-printed pattern. Learn more about screen-printed versus spandrel glass at vitrum.ca.

COLOR SELECTION

Choosing the right color for your building facade is a significant step in the design process. To make color selection easier for architects and building owners, we have created Vitrum Standard Colors for Opaci-Coated spandrel glass. **Vitrum Standard Colors** are available with no additional lead times and provide cost-savings due to high-volume use. To help meet your design vision, Vitrum also offers a full range of color options through our in-house **Custom Color Match** system which has the ability to match nearly any color found on a color chip, including bright and vivid colors. Find your perfect color today by requesting a sample at vitrum.ca or **1.888.391.1166.**

The colors and photos in this brochure are an illustrative example of the actual color. Cameras, computer monitors, and printers all interpret color differently. Vitrum highly recommends a glass sample be requested and viewed under various lighting conditions and angles. After viewing glass samples and approving the color, we recommend that our clients order a full-size mock-up to be viewed and approved on site by all stakeholders.
